Nottingham & Nottinghamshire

PRIMARY CARE NETWORKS
HEALTH AND CARE PROFILE
Version 1.6

Sherwood PCN

Prepared by Nottinghamshire County Council and Nottingham City Council, Public Health Intelligence

Purpose of this profile

- These profiles are a detailed view covering the various aspects of the health, wellbeing and social care of the different Primary Care Networks (PCNs)

- They are intended to help inform the needs of the local population, to assist and support the planning of local services

- They will allow organisations and teams working in PCNs to develop tailored approaches to engagement and communications and understand issues unique to each population

- The intention is that they are conversation starters for local government, health and social services and the community

What does this profile reveal about this PCN

- This PCN is responsible for 18% of the registered patients in Mid Notts ICP making it one of the larger of the 6 PCNs in the ICP.

- The population structure is typical of an aging population; it is largely white and reasonably affluent, though with some rural deprivation.

- Life Expectancy is comparable with England but Healthy Life Expectancy is poor, meaning a longer proportion of life may be spent in poor health.

- Prevalence of chronic disease and cancer is higher than nationally, as is obesity; smoking prevalence is similar to the England average.

- Primary care disease management (as measured by QOF) is at least as good as England and better in some disease areas.
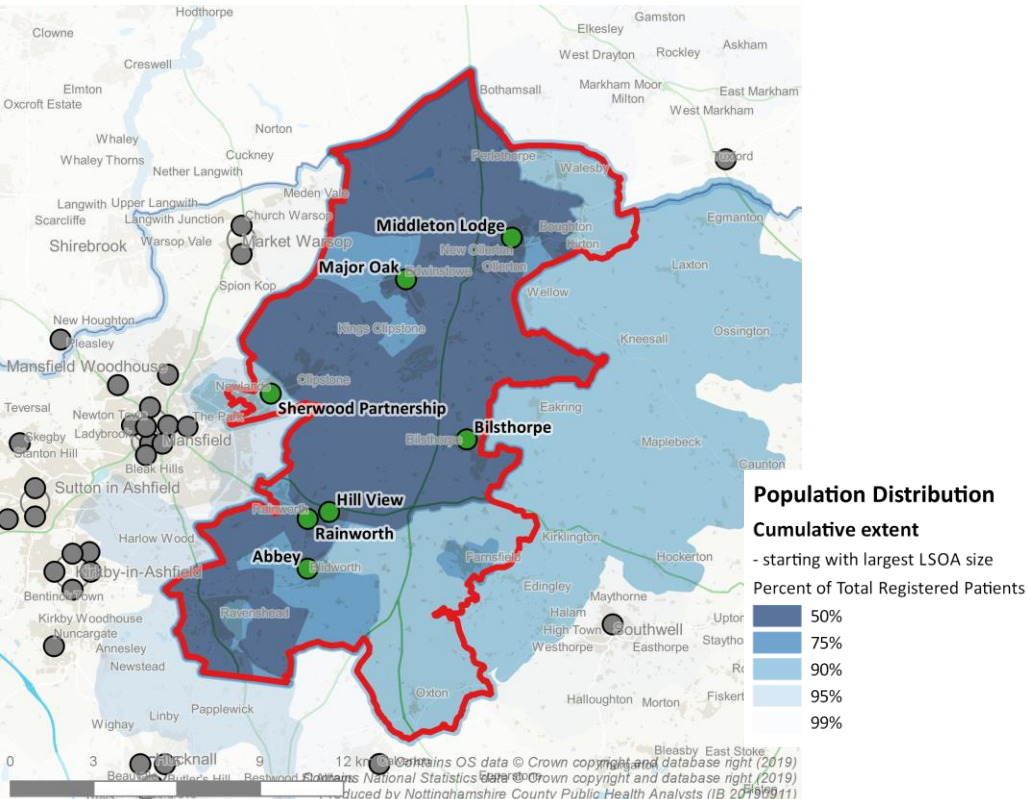

Quick statistics for this PCN

- There are a total of 59,890 patients registered with practices in this PCN. Of these 86% live within the nominal PCN boundary.

- 92% of the population resident within the PCN boundary are registered with its GP practices.

- Compared to the ICP as a whole, the PCN has a lower proportion of children and young adults and a higher proportion of older people.

- 3.5% of the population provide 50 hours or more of unpaid care each week, higher than the ICP and England average.

- BME groups form 2% of the resident population, lower than the ICP and England average.

- 7.4% of people rate their health as 'bad' or 'very bad, higher than the ICP and England average.

- The area is less deprived than the ICP, with 16% of the population living in areas defined as the most deprived 20% in England.

- Only 46.3% of school children achieve five A* - C grade GCSEs; this compares 56.6% for England.

- Use of residential and nursing home care for people under 65 is higher than England.

- Incidence of lung cancer is higher compared to the England average.

- All-age death rates for all causes and cancer are higher than England.

- The death rate from all causes and cancer among people aged under 75 is higher than England.
This PCN boundary covers the west of Newark & Sherwood District, including a small patch of Mansfield District and part of Gedling Districts. It is largely rural.

- There are 7 GP practices in this PCN (shown in green).

Sherwood PCN

Patient population density

The nominal area for this PCN boundary covers the west of Newark & Sherwood District, spreading into Mansfield and Gedling Districts.

- There are 7 GP practices in this PCN.

- 86% of patients registered with the practices live within the boundary.

- 92% of people resident within the boundary area are registered with PCN practices.

## Patient population pyramid
Source: NHS Digital 'Patients registered at GP practices' (April 2019 extract)

This chart shows the April 2019 GP registered population for the PCN, ICP and England.

- There are a total of 59,890 patients registered with the GP practices

- Overall the population profile shows a smaller proportion of children and young adults and a larger proportion of older people.
Sherwood PCN

Deprivation (Income Domain)
Source: MHCLG Indices of Income Deprivation (2019) (including ONS Population Estimates 2015), ICP spatial boundary, locally agreed PCN spatial boundaries

- 25.1% of children in this PCN are living in areas defined as the most deprived 20% in England.
- This is lower than for the ICP but higher than England.

Deprivation (Index of Multiple Deprivation)

Source: MHCLG Index of Multiple Deprivation (IMD) (2019) (including ONS Population Estimates 2015), ICP spatial boundary, locally agreed PCN spatial boundaries

Self reported health and care
Source: Census2011 tables, ICP spatial boundary, locally agreed PCN spatial boundaries

- Compared to the ICP and England, higher proportions of this PCN population report that their health is bad or very bad, or that their daily activities are limited by health or disability.

Ethnicity
Source: Census2011 tables, ICP spatial boundary, locally agreed PCN spatial boundaries

- Only 2% of the resident population is from a BME background.
- This is lower than across the ICP and much lower than England.

Public Health England Local Health Indicators

Local Health is a collection of health information to help understand the health and wider determinants of health of populations in small geographical areas.

Local Health contains indicators relate to Population and demographic factors, Wider determinants of health and Health outcomes and are split across four domains:

- Our Community
- Behavioural risk factor and child health
- Disease and poor health
- Life expectancy and causes of death

Values for PCNs are estimated using the small area data and are compared to the overall England value. The spine chart shows how these values vary in relation to other small areas in England.

This PCN value

Shading and border show comparison to England

England average

Central 50 % of values

Lower or Worse than England

Higher or Better than England

- 🟠 SIMILAR to England
- 🟢 Significantly BETTER than England
- 🔴 Significantly WORSE than England
- ⚪ Not tested
- 🔵 Significantly HIGHER than England
- 🔵 Significantly LOWER than England

These indicators are based on resident populations which should not differ greatly from the registered population unless the registered population has a wide spatial distribution.

Features to note for this PCN

- Life expectancy at birth for Females is higher than for Males
    - Life expectancy for Males in 2013-17 was 78.6 years
    - … and for Females was 82.0 years
- Females live in poor health for longer than Males
    - The gap between Life expectancy and Healthy life expectancy in 2009-13 was 18.1 years for Males
    - … and 20.0 years for Females
- Generally, the population is relatively affluent and in reasonably good health; local health indicators are generally comparable to England averages.
- Areas where this PCN fares worse than England include:
    - GCSE attainment
    - Teenage motherhood
    - Hospital admissions for children and selected conditions
    - Incidence of lung cancer
    - Hospital stays for alcohol related harm
    - High proportion of people with limiting long term illness
    - High prevalence of back pain and severe back pain
    - Higher death rates for some conditions
    - Shorter healthy life expectancy

Social care measures

These are local breakdowns of datasets relating to the Short and Long Term Support (SALT) submissions for the national collection.
Two years of data are combined (2017/18 and 2018/19) and include cross-border City and County residents.

Measure 1: Adults (aged 18+) supported in long-term residential and nursing care at the year-end 31 March

1A: Younger adults (aged 18-64)	1B: Older adults (aged 65 and over)
258.3 per 100,000 residents (160 clients)	**1,258.3** per 100,000 residents (290 clients)
This rate is higher than England	This rate is lower than England
England: 122.9 per 100,000 residents	England: 1,478.7 per 100,000 residents

Measure 2: Adults (aged 18+) accessing long-term community support at the year-end 31 March

2A: Younger adults (aged 18-64)	2B: Older adults (aged 65 and over)
766.7 per 100,000 residents (475 clients)	**1,822.4** per 100,000 residents (420 clients)
This rate is higher than England	This rate is lower than England
England: 630.3 per 100,000 residents	England: 2,327.7 per 100,000 residents

Measure 3: Long-term support needs of adults (aged 18+) met by admission to residential and nursing care homes
Lower rates are considered better

3A: Younger adults (aged 18-64)	3B: Older adults (aged 65 and over)
24.2 per 100,000 residents (15 clients)	**477.3** per 100,000 residents (110 clients)
This rate is similar to England	This rate is better than England
England: 13.9 per 100,000 residents	England: 582.8 per 100,000 residents

Measure 4: Proportion of older people (65 and over) who were still at home 91 days after discharge from hospital into reablement / rehabilitation services
Higher percentages are considered better

4: Older adults (aged 65 and over)

79.7 percent
(55 clients)

This percentage is similar to England

England Value: 82.7 percent

Quality outcomes framework (QOF)

- The QOF is a performance, management and payment system for General Practices.

- GPs keep a record of people with specific diseases such as

  - chronic chest disease (COPD)
  - diabetes
  - heart disease (CHD)
  - mental health
  - dementia
  - atrial fibrillation
  - asthma
  - learning disability
  - osteoporosis
  - palliative care, and
  - smoking

- These registers are used to calculate recorded disease prevalence, which is compared to England in these profiles.

- The data in this profile is for the year 2018/19. The figures may be under estimates due to people not presenting to their GP, not being diagnosed or not being recorded.
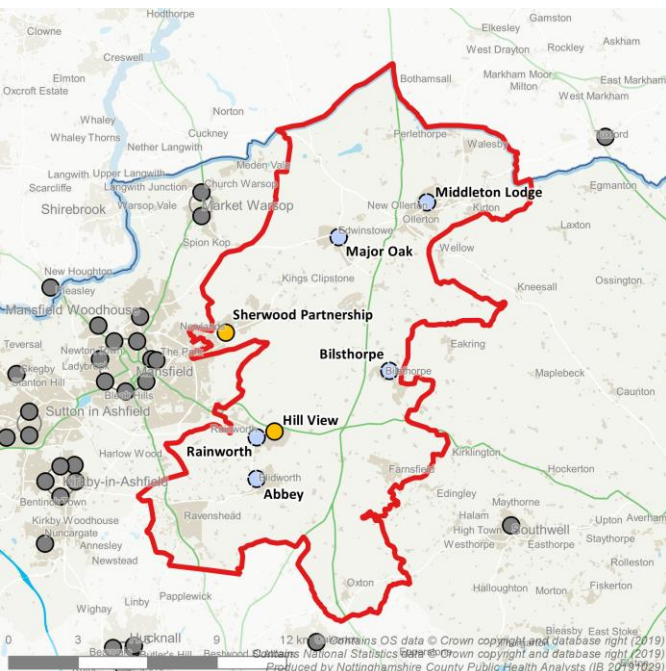

COPD prevalence
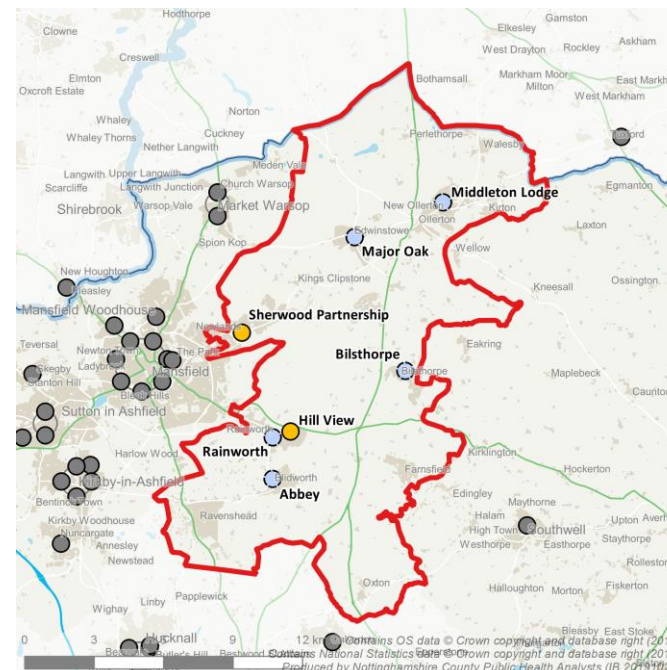

COPD is the name for a collection of chronic chest diseases. People with COPD have difficulties breathing due to a narrowing of their airways. Smoking is the main cause of COPD – more than 4 out of 5 people who develop the disease are, or have been smokers.

- The PCN population had a higher prevalence of COPD than England.

- 96.7% of patients had their diagnosis confirmed by post bronchodilator spirometry, similar to the England average of 96.3%.

- 80.2% of patients had received an influenza vaccination; similar to the England average of 78.4%.

Integrated Care System
Nottingham & Nottinghamshire

Sherwood PCN

Diabetes prevalence

QOF disease prevalence
Relative to England
- Lower
- Similar
- Higher
- Not compared
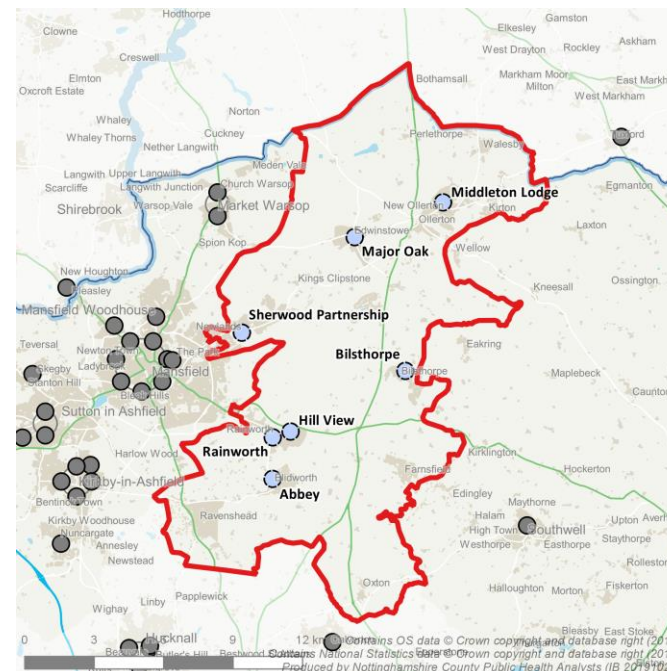

Type 2 diabetes is linked to many health complications such as heart disease, eye problems, kidney disease and problems with circulation. It is important that diabetes is diagnosed early and well managed.

- The PCN population had a higher prevalence of diabetes (8.1%) than the England population (6.9%).

- 69.8% of patients had well controlled (HbA1c of 64mg or less) blood sugar, similar to England average.

- The uptake of influenza immunisation (79.4%) was better than England.

- However, referral to structured education was lower than England.

CHD prevalence

QOF disease prevalence
Relative to England
- Lower
- Similar
- Higher
- Not compared

Coronary heart disease is caused by a build up of fatty deposits on the walls of the arteries around the heart (coronary arteries). Smoking, high blood pressure, lack of exercise, diabetes or being overweight or obese all increase the risk of CHD.

- The PCN population had a higher prevalence than the England population; 4.3% compared with 3.1%.

- 82.2% of CHD patients had well controlled blood pressure, better than the England average (80.6%).

- 82.3% of CHD patients had taken aspirin or anti-clotting medication. This is better than the England average (79.6%).

Mental health prevalence

Dementia prevalence
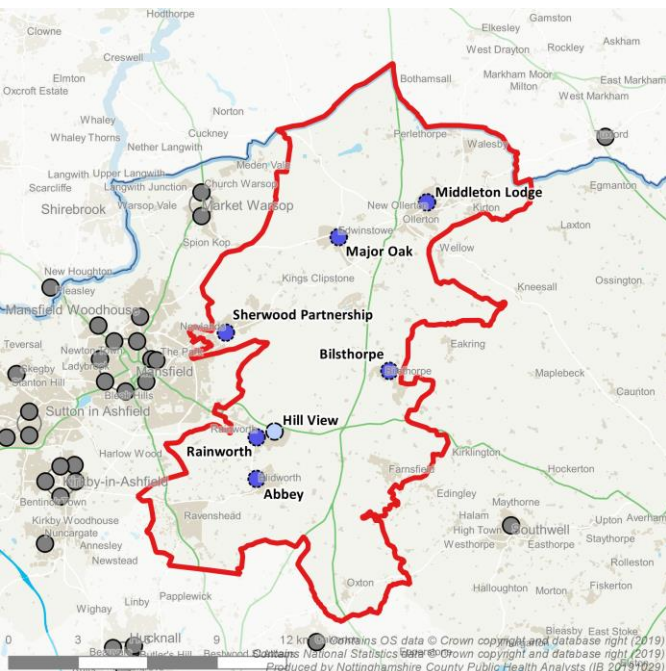

This includes all patients with a diagnosis of schizophrenia, bipolar affective disorder or other psychoses. Mental illness can result in high levels of disability and a reduced quality of life for patients, families and carers.

- The PCN population had a lower prevalence than England; 0.7% compared to 1% for England.

- 68% of patients had a comprehensive care plan. This is similar to England (70.5%).

- 92.5% of eligible women in this group had a cervical smear in the previous 5 years compared to 94% in England.
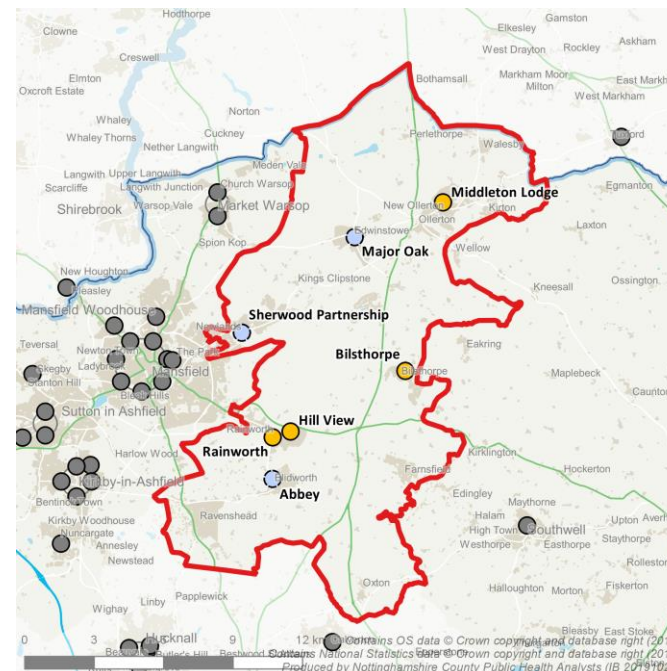

Dementia affects the brain and its abilities. This includes problems with memory loss, thinking speed, mental agility, language, understanding and judgement.

- The PCN population had a higher prevalence than England; 1.0% compared to 0.8% for England.

- 74% of patients had a face-to-face review in the previous 12 months. This is higher than the England average of 70.3%.

- 85.8% of patients newly diagnosed with dementia had records of key test results soon after diagnosis; similar to the England average (83.7%).

Integrated Care System
Nottingham & Nottinghamshire

Atrial fibrillation prevalence

QOF disease prevalence

Relative to England

- Lower
- Similar
- Higher
- Not compared

Produced by Nottinghamshire County Public Health Analysts (IB 20191029)
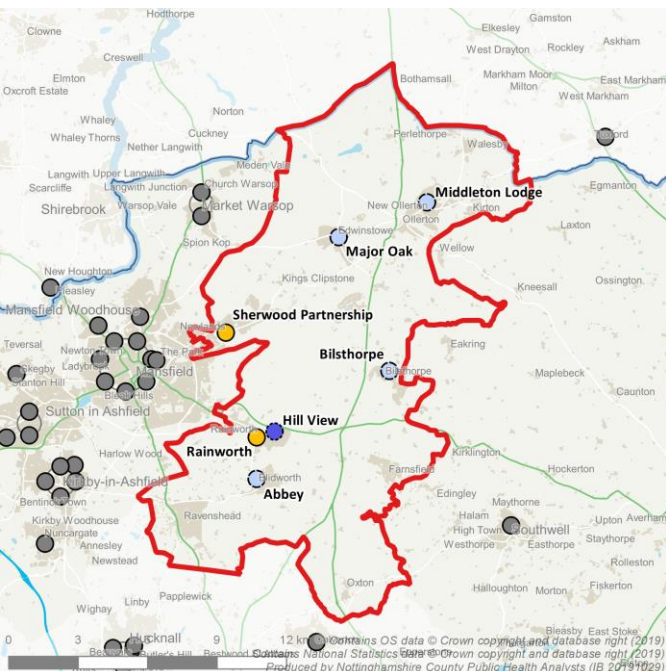

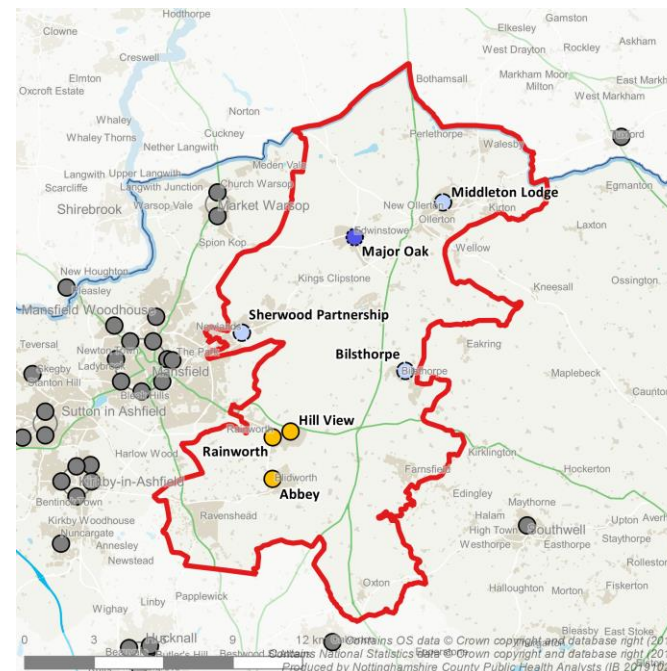

AF is the most common sustained cardiac arrhythmia. Men are more commonly affected than women and the prevalence increases with age. In people who have had a stroke, concurrent AF is linked with a higher rate of mortality, disability, longer hospital stay and lower rate of discharge home.

- The PCN population had a significantly higher prevalence than England; 2.3% compared with 2.0%.

- The proportion having their risk of stroke assessed (85.8%) was similar to the England average (82.1%).

- Anticoagulant treatment of at risk patients (83.9%) was similar to the England average (81.1%).

Asthma prevalence

QOF disease prevalence

Relative to England

- Lower
- Similar
- Higher
- Not compared

Contains OS data © Crown copyright and database right (2019)

Produced by Nottinghamshire County Public Health Analysts (IB 20191029)

Asthma is a common respiratory condition which responds well to appropriate management and which is principally managed in primary care.

- The PCN population had a higher prevalence (6.5%) than England (6.0%).

- Recording of smoking status (age 14-19 years) was better than the England average; 81.9% compared to 78%.

- Asthma review had been carried out in 92.7% of patients, better than the England average (91.6%).

- Recorded variability/reversibility (91.9%) was better than the England average (88.5%).

Learning disabilities prevalence
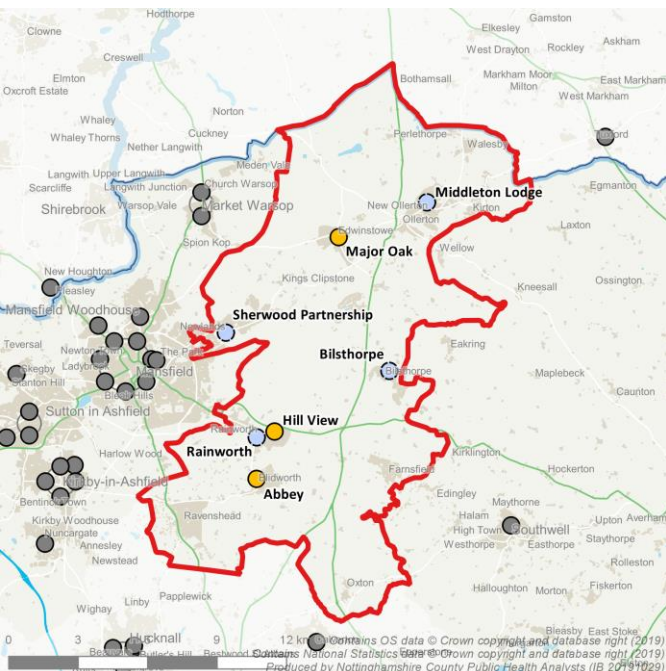

People with learning disabilities are among the most vulnerable and socially excluded in our society. Virtually all people with learning disabilities are now living in the community and depend on general practice for their primary care needs.

- The PCN population had a prevalence of 0.8%; higher than the England average (0.5%).

Osteoporosis (secondary prevention) prevalence
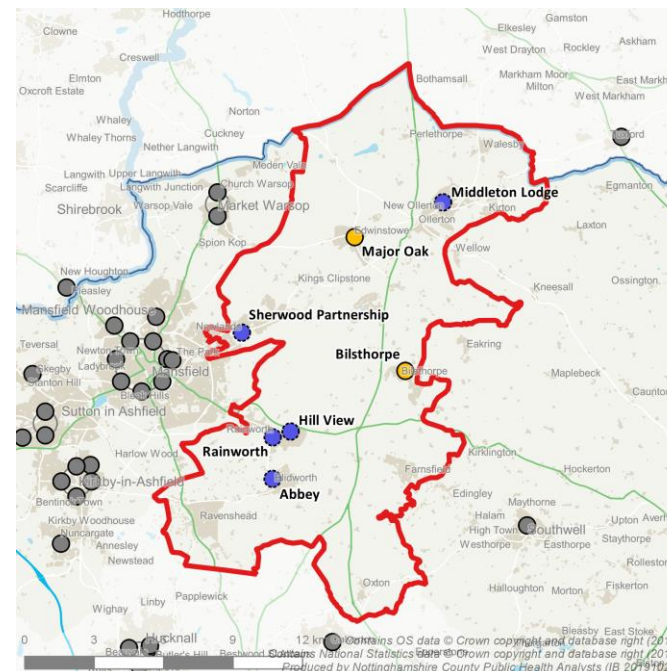

Osteoporotic fragility fractures can cause substantial pain and severe disability and are associated with decreased life expectancy. They occur most commonly in the spine, hip and wrist. They also occur in the arm, pelvis, ribs and other bones.

- The PCN population had a significantly lower prevalence (0.4%) than England (0.8%).

- The proportion of people age 50-74 treated with bone sparing agent (63.2%) was lower than the England average (68.1%).

- The proportion of those treated that were age 75 or over was similar to England; 91.9% compared with 90.6%.

Integrated Care System

Palliative care prevalence
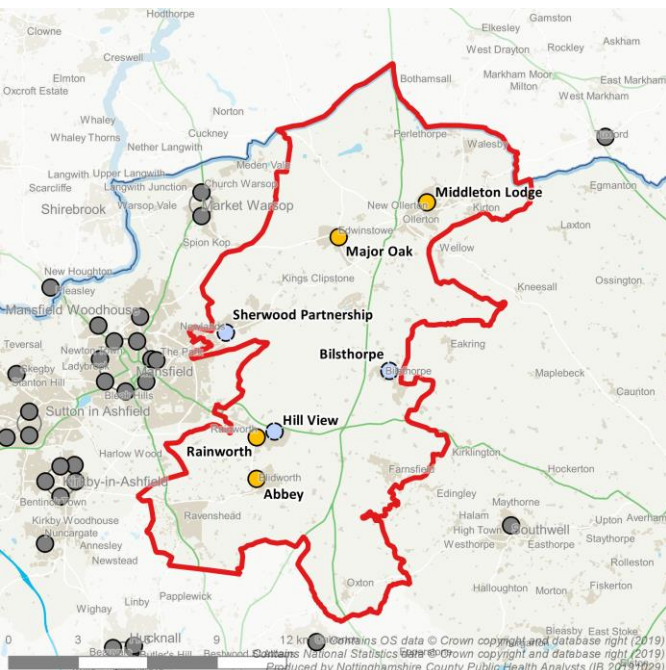

QOF disease prevalence

Relative to England

- Lower
- Similar
- Higher
- Not compared

Palliative or end of life care is the active total care of patients with life-limiting disease and their families by a multi-professional team.

- The prevalence of patients receiving palliative care is significantly higher than the England average; 0.5% compared to 0.4%.

Smoking prevalence

Prevalence

Relative to England

- Lower
- Similar
- Higher
- Not compared

The percentage of patients age 15 and over with current status of smoker recorded in last 2 years. High risk smokers are those with any combination of the following conditions: CHD, PAD, stroke or TIA, hypertension, diabetes, COPD, CKD, asthma, schizophrenia, bipolar affective disorder or other psychoses whose notes record smoking status in the preceding 12 months.

- The PCN population had a similar smoking prevalence to England; 16.8% compared with 16.6%.

- A significantly higher proportion of high risk smokers were offered support and treatment in the last 12 months (83.8%) compared to the England average (79.7%).

DTAP 5yrs immunisation uptake

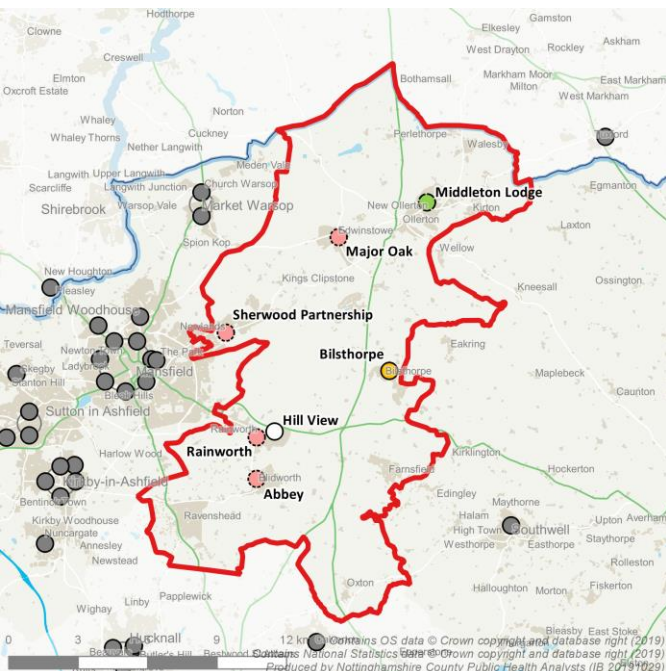

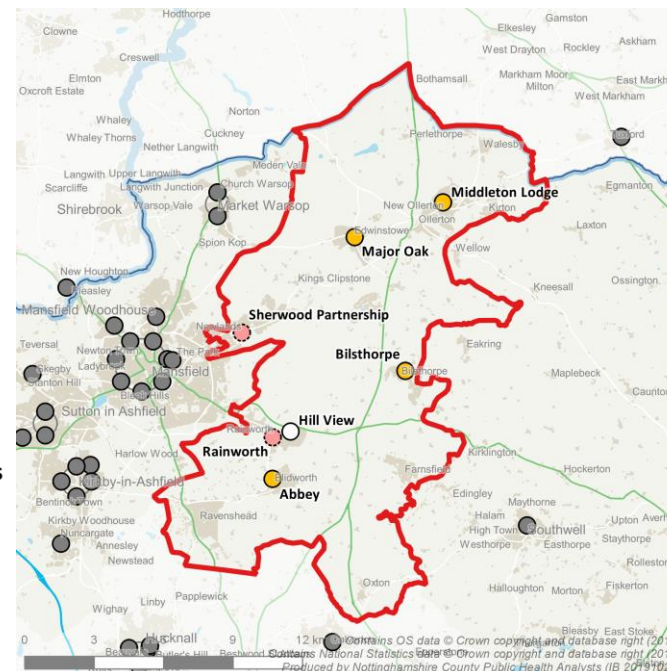

Vaccinations and Immunisations

Coverage

Relative to 95%

- ○ Less than 90%
- ○ Between 90% - 95%
- ○ 95% and over
- ○ No data

Diphtheria is a highly contagious bacterial infection that mainly affects the nose and throat.

- Overall, the PCN achieved immunisation uptake at age 5 of 85.7% during 2018/19, not reaching 90% coverage.
- Four of the 7 practices did not reach 90% coverage.

MMR uptake

Vaccinations and Immunisations

Coverage

Relative to 95%

- ○ Less than 90%
- ○ Between 90% - 95%
- ○ 95% and over
- ○ No data

MMR is a combined vaccine that protects against three separate illnesses; measles, mumps and rubella (German measles). These are highly infectious conditions that can have serious, potentially fatal, complications.

- Overall, the PCN achieved 87.6% immunisation uptake at age 5 during 2018/19, not reaching 90% coverage.
- Two of the 7 practices did not reach 90% coverage.
