

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE Version 1.6

**South Neighbourhood** 

Prepared by Nottinghamshire County Council and Nottingham City Council, Public Health Intelligence

# Purpose of this profile

- These profiles are a detailed view covering the various aspects of the health, wellbeing and social care of the different Primary Care Networks (PCNs)
- They are intended to help inform the needs of the local population, to assist and support the planning of local services
- They will allow organisations and teams working in PCNs to develop tailored approaches to engagement and communications and understand issues unique to each population
- The intention is that they are conversation starters for local government, health and social services and the community

# What does this profile reveal about this Neighbourhood

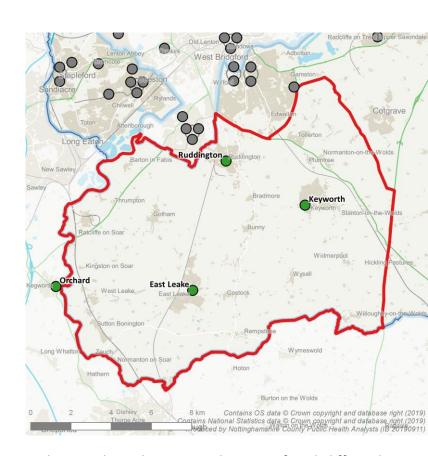

- This Neighbourhood is responsible for 11% of the registered patients in South Notts ICP and 31% of the registered patients in Rushcliffe PCN.
- The population structure is typical of an aging population apart from a spike of 20-24 year olds; it is predominantly white and relatively affluent.
- Life Expectancy and Healthy Life Expectancy compare well with national figures, the population live long and healthy lives.
- Prevalence of circulatory diseases and cancer is higher than nationally but primary care (as measured by QOF) is at least as good as England and better in many disease areas.

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

#### Quick statistics for this Neighbourhood (NHD)

- There are a total of 40,478 patients registered with practices in this NHD; (49% male). Of these, 79% live within the nominal NHD boundary.
- 92% of the population residing within the NHD boundary are registered with its GP practices.
- Compared to the ICP as a whole, the NHD has a lower proportion of children and younger adults (25-49 years) and a higher proportion of elderly people.
- There is a spike of student-age young people, particularly women compared to the ICP.
- 2% of the population provide 50 hours or more of unpaid care each week, slightly lower than the ICP and England average.
- BME groups form 3.7% of the resident population, slightly over half the ICP proportion and one quarter the England level.

- Asian and mixed ethnic groups form the predominant BME groups in the area.
- 3.8% of people rate their health as 'bad' or 'very bad', lower than the England rate of 5.5%.
- The area is relatively affluent with no areas defined within the 40% most deprived areas in England.
- Over 68% of school children achieve five A\* - C grade GCSEs; this compares 56.6% in England.
- Incidence of colorectal cancer is higher than expected compared to England.
- All-age death rates for all causes and selected causes are lower than expected.
- The death rate from all causes and selected causes among people aged under 75 is lower than expected compared to England.

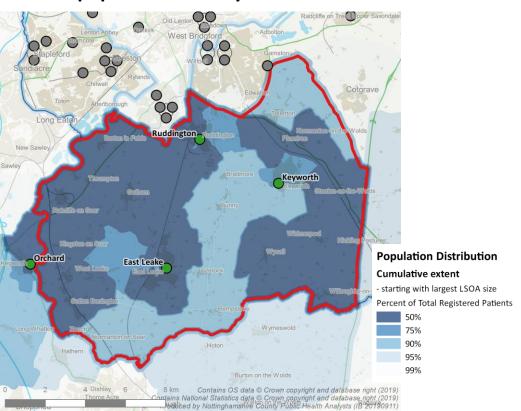

This NHD boundary covers the west of Rushcliffe and is largely rural with small towns and villages.

 There are 4 GP practices in this NHD (shown in green) covering 32% of the PCN registered patients.

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

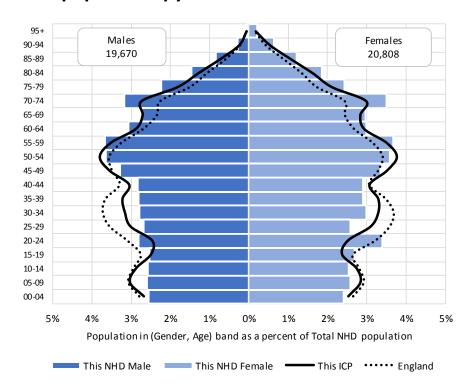

#### **Patient population density**

The nominal area for this NHD covers the west of Rushcliffe and is largely rural with small towns and villages.

- There are 4 GP practices in this NHD.
- 79% of patients registered with the practices live within the boundary.
- 92% of people living within the boundary area are registered with NHD practices.

#### Patient population pyramid

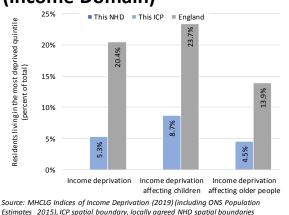

Source: NHS Digital 'Patients registered at GP practices' (April 2019 extract)

This chart shows the April 2019 GP registered population for the NHD, ICP and England.

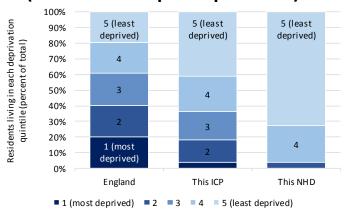

- There are a total of 40,478 patients registered with the GP practices.
- Overall the population profile shows a lower proportion of children and young adults than the ICP and England apart from a student-age spike.
- The proportion of older people is higher than the ICP population.

#### **Deprivation (Income Domain)**

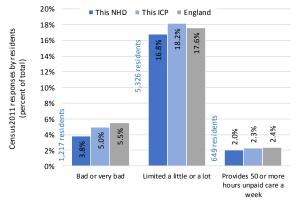

• This is a relatively affluent population with no significant deprivation.

#### **Deprivation (Index of Multiple Deprivation)**

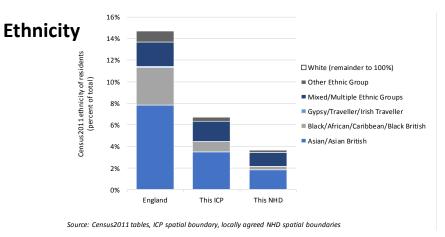

Source: MHCLG Index of Multiple Deprivation (IMD) (2019) (including ONS Population Estimates 2015), ICP spatial boundary, locally agreed NHD spatial boundaries

#### Self reported health and care

Source: Census2011 tables, ICP spatial boundary, locally agreed NHD spatial boundaries

 Compared to the ICP and England, lower proportions of this NHD population report that their health is bad or very bad, or that their daily activities are limited by health or disability.

- 3.7% of the resident population is from a BME background.
- This is lower than across the ICP (6.7 %).

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

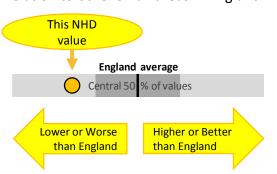

#### **Public Health England Local Health Indicators**

Local Health is a collection of health information to help understand the health and wider determinants of health of populations in small geographical areas.

Local Health contains indicators relate to Population and demographic factors, Wider determinants of health and Health outcomes and are split across four domains:

- Our Community
- Behavioural risk factor and child health
- Disease and poor health
- Life expectancy and causes of death

Values for NHDs are estimated using the small area data and are compared to the overall England value. The spine chart shows how these values vary in relation to other small areas in England.

Shading and border show comparison to England

- O SIMILAR to England
- Significantly BETTER than England
- Significantly WORSE than England
- Not tested
- Significantly HIGHER than England
- Significantly LOWER than England

These indicators are based on resident populations which should not differ greatly from the registered population unless the registered population has a wide spatial distribution.

#### Features to note for this NHD

- Life expectancy at birth for Females is higher than for Males
  - Life expectancy for Males in 2013-17 was 81.8 years
  - o ... and for Females was 85.1 years
- Females live in poor health for longer than Males
  - The gap between Life expectancy and Healthy life expectancy in 2009-13 was 13.3 years for Males
  - o ... and 15.4 years for Females
- Generally, the population is relatively affluent and in good health; local health indicators are generally comparable to or better than England averages.
- Areas where this NHD fares worse than England include:
  - o a higher than expected incidence of colorectal cancer.
  - o a high prevalence of back pain and severe back pain.

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

#### Social care measures

These are local breakdowns of datasets relating to the Short and Long Term Support (SALT) submissions for the national collection. Two years of data are combined (2017/18 and 2018/19) and include cross-border City and County residents.

| Measure 1: Adults (aged 18+) supported in long-term residential and nursing care at the year-end 31 March |  |  |  |  |  |  |

measure 4: Proportion of older people (65 and over) who were still at home 91 days after discharge from hospital into reablement / rehabilitation services

Higher percentages are considered better

4: Older adults (aged 65 and over)

43.5 percent
(10 clients)

This percentage is worse than England

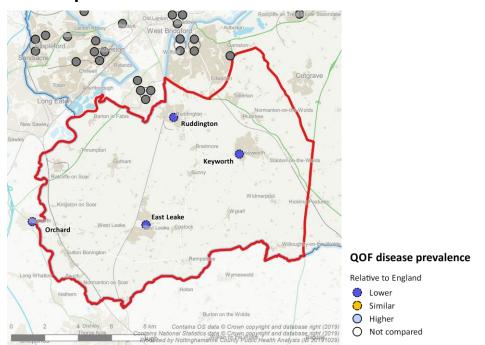

England Value: 82.7 percent

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

#### Quality outcomes framework (QOF)

- The QOF is a performance, management and payment system for General Practices.
- GPs keep a record of people with specific diseases such as
  - chronic chest disease (COPD)
  - diabetes
  - heart disease (CHD)
  - mental health
  - dementia
  - atrial fibrillation
  - asthma
  - learning disability
  - osteoporosis
  - palliative care, and
  - smoking
- These registers are used to calculate recorded disease prevalence, which is compared to England in these profiles.
- The data in this profile is for the year 2018/19. The figures may be under estimates due to people not presenting to their GP, not being diagnosed or not being recorded.

#### **COPD** prevalence

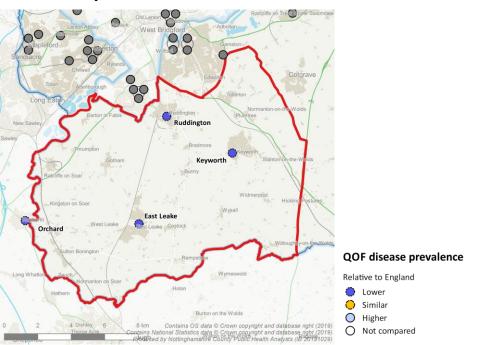

COPD is the name for a collection of chronic chest diseases. People with COPD have difficulties breathing due to a narrowing of their airways. Smoking is the main cause of COPD – more than 4 out of 5 people who develop the disease are, or have been smokers.

- The NHD population had a lower prevalence of COPD than England (1.5% compared to 1.9%)
- 95.7% of patients had their diagnosis confirmed by post bronchodilator spirometry, similar to the England average of 96.3%.
- 85.7% of patients had received an influenza vaccination; higher than the England average of 78.4%.

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

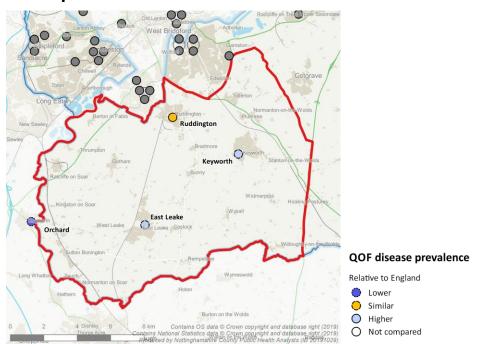

#### **Diabetes prevalence**

Type 2 diabetes is linked to many health complications such as heart disease, eye problems, kidney disease and problems with circulation. It is important that diabetes is diagnosed early and well managed.

- The NHD population had a lower prevalence of diabetes (5.9%) than the England population (6.9%)
- 75.7% of patients had well controlled (HbA1c of 64mg or less) blood sugar, better than the England average.
- The uptake of influenza immunisation (82.7%) was better than England.
- However, referral to structured education was worse than England.

#### **CHD** prevalence

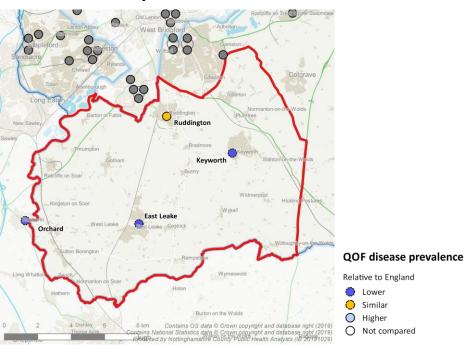

Coronary heart disease is caused by a build up of fatty deposits on the walls of the arteries around the heart (coronary arteries). Smoking, high blood pressure, lack of exercise, diabetes or being overweight or obese all increase the risk of CHD.

- The NHD population had a higher prevalence than the England population; 3.3% compared with 3.1%.
- 83.1% of CHD patients had well controlled blood pressure, similar to the England average (80.6%).
- 91.9% of CHD patients had taken aspirin or anti-clotting medication. This is better than the England average (79.6%).

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

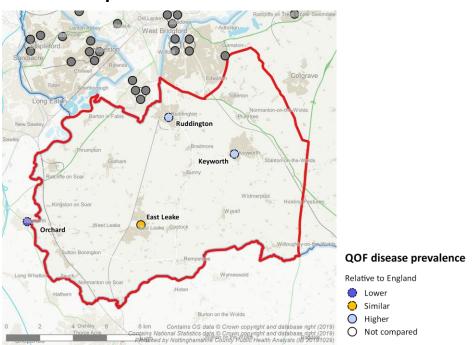

#### Mental health prevalence

This includes all patients with a diagnosis of schizophrenia, bipolar affective disorder or other psychoses. Mental illness can result in high levels of disability and a reduced quality of life for patients, families and carers.

- The NHD population had a lower prevalence than England; 0.5% compared to 1% for England.
- 75% of patients had a comprehensive care plan. This is similar to England (70.5%).
- 95.3% of eligible women in this group had a cervical smear in the previous 5 years compared to 94% in England.

#### **Dementia prevalence**

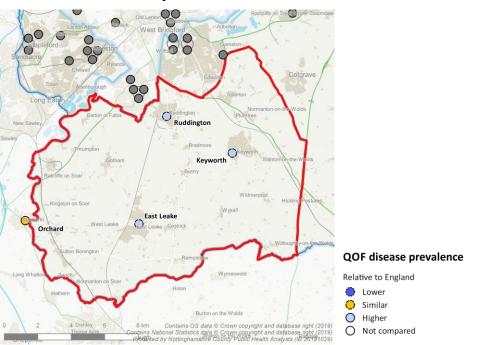

Dementia affects the brain and its abilities. This includes problems with memory loss, thinking speed, mental agility, language, understanding and judgement.

- The NHD population had a higher prevalence than England; 1.0% compared to 0.8% for England.
- 81.7% of patients had a face-to-face review in the previous 12 months. This is higher than the England average of 70.3%.
- 87.1% of patients newly diagnosed with dementia had records of key test results soon after diagnosis; similar to the England average (83.7%).

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

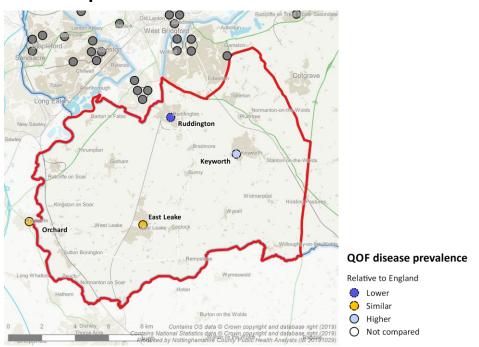

#### **Atrial fibrillation prevalence**

AF is the most common sustained cardiac arrhythmia. Men are more commonly affected than women and the prevalence increases with age. In people who have had a stroke, concurrent AF is linked with a higher rate of mortality, disability, longer hospital stay and lower rate of discharge home.

- The NHD population had a significantly higher prevalence than England; 2.7% compared with 2.0%.
- The proportion having their risk of stroke assessed (89.3%) was higher than the England average (82.1%).
- Anticoagulant treatment of at risk patients (90%) was higher than the England average (81.1%).

#### Asthma prevalence

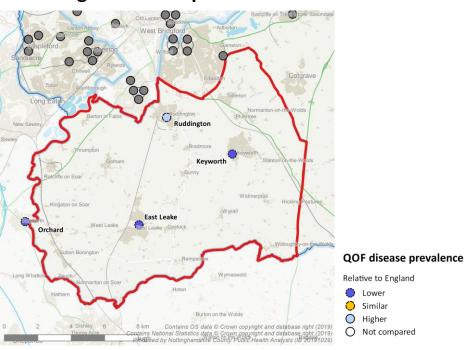

Asthma is a common respiratory condition which responds well to appropriate management and which is principally managed in primary care.

- The NHD population had a similar prevalence (6.2%) to England (6.0%).
- Recording of smoking status (age 14-19 years) was better than the England average; 88.8% compared to 78%.
- Asthma review had been carried out in 92.5% of patients comparable to the England average (91.6%).
- Recorded variability/reversibility (91.2%) was better than the England average (88.5%).

# PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE

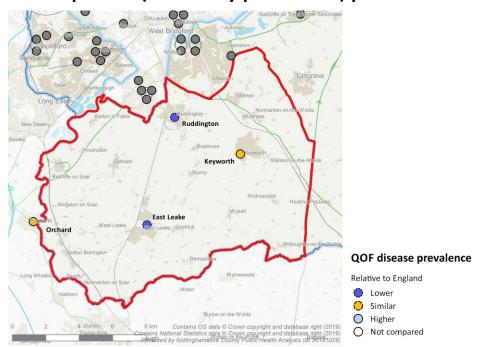

#### Learning disabilities prevalence

People with learning disabilities are among the most vulnerable and socially excluded in our society. Virtually all people with learning disabilities are now living in the community and depend on general practice for their primary care needs.

• The NHD population had a prevalence 0.3%; lower than the England average (0.5%).

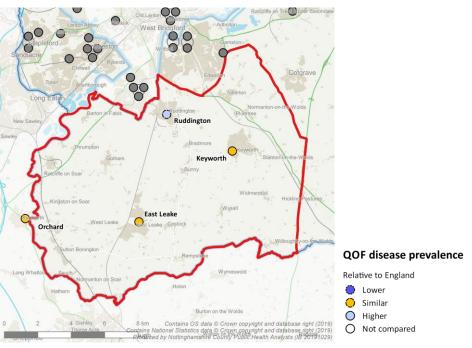

#### Osteoporosis (secondary prevention) prevalence

Osteoporotic fragility fractures can cause substantial pain and severe disability and are associated with decreased life expectancy. They occur most commonly in the spine, hip and wrist. They also occur in the arm, pelvis, ribs and other bones.

- The NHD population had a significantly lower prevalence (0.6%) than England (0.8%).
- The proportion of people age 50-74 treated with bone sparing agent (75.7%) was better than the England average (68.1%).
- The proportion of those treated that were age 75 or over was similar to England; 90.1% compared with 90.6%.

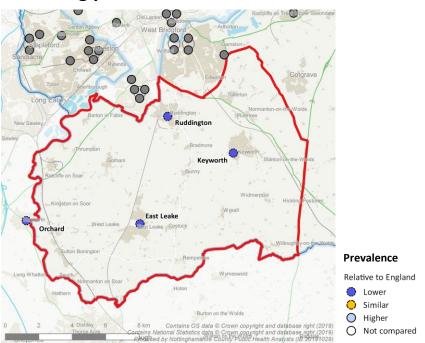

#### Palliative care prevalence

Palliative or end of life care is the active total care of patients with lifelimiting disease and their families by a multi-professional team.

• The prevalence of patients receiving palliative care is similar to the England average; 0.44% compared to 0.40%.

#### **Smoking prevalence**

The percentage of patients age 15 and over with current status of smoker recorded in last 2 years. High risk smokers are those with any combination of the following conditions: CHD, PAD, stroke or TIA, hypertension, diabetes, COPD, CKD, asthma, schizophrenia, bipolar affective disorder or other psychoses whose notes record smoking status in the preceding 12 months.

- The NHD population had a significantly lower smoking prevalence than England; 10% compared with 16.6%.
- A significantly higher proportion of high risk smokers were offered support and treatment in the last 12 months (84.7%) compared to the England average (79.7%).

#### **DTAP 5yrs immunisation uptake**

Diphtheria is a highly contagious bacterial infection that mainly affects the nose and throat.

• The practices achieved immunisation uptake at age 5 of 94.2% during 2018/19.

#### MMR uptake

MMR is a combined vaccine that protects against three separate illnesses; measles, mumps and rubella (German measles). These are highly infectious conditions that can have serious, potentially fatal, complications.

• The practices achieved 96.6% immunisation uptake at age 5 during 2018/19, reaching at least 95% coverage.
